

Calgary to Chicago in a 206? **No Problem.**

Frequently land short on your long-distance flights? Discover the added range that the Sierra/SkyWay 206/207 **Auxiliary Fuel System Enhancement** can provide. Carefully located to maintain your aircraft's existing balance and center of gravity, this system adds an additional 50 gallons of fuel capacity to your existing fuel system.

This practical enhancement adds as much as 650 nautical miles to the range of your Cessna 206 or 207. The tough, durable vulcanized rubber tanks are completely integrated with the existing fuel system, with no additional switches or gauges to worry about.

Engineered and built to exacting F.A.R. Part 23 standards and proven over decades, this enhancement is FAA approved for all Cessna 206/207 models, including aircraft with high-performance Soloy Mark I and II turbine upgrades. It is available in kit form or it can be installed in Skyway's Uvalde, TX facilities by our certified FAA mechanics. Either way, you'll enjoy substantially increased range and flexibility as well as added peace of mind.

Just fill up your tanks and go!
